

BODYGRIP 110 SETTING INSTRUCTIONS

Before setting the trap adjust the trigger wires to the profile you wish to use. This will be a profile appropriate to the intended target.

Extend spring so it is pointed directly away from the trap. Then using your right hand, with palm uppermost, grip the spring with the trap frame to your left and the trigger and dog on the uppermost frame.

With your left hand grip the trap frame, the jaw closest to you with your thumb and the one furthest away with your fingers.

Then compress the spring, and as you compress simultaneously pull the trap frames together with your left hand.

With the trap frames gripped in your left hand let go of the spring and engage the safety clip over both spring arms at the trap end of the spring and slide it back towards the spring loop. If the trap does then inadvertently fire the closing impact will be substantially reduced.

Position the trigger and dog at the desired location along the frame (this will be in the centre if you are using a Magnum Cubby/Tunnel) and then set the preferred notch of the dog into the centre of the trigger.

Be sure the trigger is secure within the notch of the dog. Then grip the compressed spring and release the frames slowly. Disengage the safety clip when the trap is in position. The spring can be swung to the side if necessary for the desired setting position.
